FOUNDER-LED GROWTH & GTM · MASTER CASE STUDY

SolarVista3D: building a B2B visualization studio from zero

Segmentation, pricing architecture, and a repeatable demand-generation engine for the global power & renewables sector — built solo, with clients across Germany, Australia, and India.

3
countries with active clients

~70
target companies mapped

~150
contacts in outreach engine

4
pricing tiers · 3 currencies

Engineering drawings don't win approvals

SolarVista3D
Photoreal Solar Visuals

SolarVista3D is a B2B studio providing photorealistic 3D rendering, planning-grade photomontages, and cinematic animation to EPCs, solar and wind developers, IPPs, and power-infrastructure companies across India, Europe, Australia and the Gulf.

Founder-operated: segmentation, pricing, outbound, SEO, negotiation, and production delivery all run by one person — a genuinely full-funnel GTM view with every decision owned end to end.

The market problem

Renewable projects are presented as CAD drawings and engineering documents — technically accurate, illegible to the investors, planning authorities, and communities who decide their fate.

The supplier landscape is polarized: low-cost freelancers compete on price, a few premium international studios compete on trust. There is very little in between.

That gap in the middle is the business.

02 · TARGET MARKET

Five segments, five reasons to buy

SEGMENT	WHO THEY ARE	WHY THEY BUY
Solar farm developers	Utility-scale developers & IPPs	Planning approval visuals, investor decks
Transmission tower EPCs	High-voltage infrastructure firms	Route approval, landowner & community communication
Substation developers	Grid infrastructure developers	Permitting submissions, visual impact assessments
Hardware exporters	Power-equipment manufacturers	Product & installation visuals for international sales
Wind EPCs (emerging)	Wind developers & engineering studios	Turbine photomontages for planning submissions

The space between cheap and premium

LOW-COST FREELANCERS

Compete on price

Cheap, fast, generic. No renewables domain knowledge; quality risk on planning-grade work. Sets the price floor SolarVista3D refuses to chase.

SOLARVISTA3D

Compete on specialization

Engineering-aware production (GIS, CAD, terrain), premium-adjacent quality, founder economics — priced by market, never by desperation.

PREMIUM INT'L STUDIOS

Compete on trust

Established brands with agency overheads and agency prices. The quality benchmark — and the reference point EUR pricing signals parity with.

Positioning: production quality close to the premium tier, at a founder-operated cost base, sold with the discipline of a specialist — not the desperation of a generalist freelancer.

Pricing as a segmentation tool

MARKET	STRUCTURE	STRATEGIC LOGIC
India INR	Four tiers, defined pricing floor, volume-discount logic	High-volume, price-sensitive market; tiering serves small EPCs and large infrastructure players from one rate card without underpricing either
Europe EUR	Priced at European market rates	Pricing must signal parity with local studios, not an 'offshore discount' — underpricing would undermine the premium positioning referrals depend on
Middle East / int'l EPC USD	Dollar-denominated project pricing	Matches the invoicing currency cross-border EPCs already budget in, removing a procurement friction point

The discipline that mattered most: refusing to underprice international work to win it. India interest is top-of-funnel volume and proof of capability; EU and Australian accounts are margin-accretive, reference-building relationships. Rule: pricing follows the project's end-market, not the contracting office's location.

From inbound-only to an engineered pipeline

Exhibition-led: BES 2026, New Delhi

Exhibited at the Bharat Electricity Summit for direct visibility with EPC and power infrastructure buyers. Generated qualified leads including LC Infra, Advait Group, Manikaran Power, and Alfanar Projects — a concentrated domestic pipeline worked against the four-tier pricing and bilingual rate cards.

Outbound & content engine

~150 contacts across ~70 companies, segmented into Indian EPCs, international EPCs, and developer/IPP contacts — each with tailored messaging and the correct rate card. LinkedIn founder content warms contacts before email arrives, shortening the trust-building cycle.

ACCOUNT	SEGMENT	STATUS / PLAY
Solar Square	Solar developer (India)	Active pipeline; multiple stakeholders engaged
Octopus Australia	Solar & BESS developer	Priority account (Blind Creek Solar Farm & BESS); multi-threaded after a missed inbound
Alfanar Projects	EPC / Projects	Concluded — no current requirement; relationship kept warm
European wind client	Wind EPC / engineering	Closed — first wind project; expanded into flythrough quoting

06 · ACCOUNT STRATEGY

Two plays: recover a miss, expand a win

The recovery playbook

An early inbound from Octopus Australia was missed due to vacation timing. The structural response: build familiarity across multiple contacts at the account ahead of the next project cycle — converting one missed touchpoint into a deliberate multi-threaded strategy for the Blind Creek Solar Farm & BESS project.

Never again one contact away from losing a live opportunity.

The expansion play: entering wind

Through an existing German engineering client, negotiated and closed the studio's first wind-energy project: five planning-grade photomontages across two sites — a forest windpark and a Brandenburg site, both on Nordex N175 turbines. Opened a follow-on two-video CG flythrough package — a step up in scope and deal size.

Account expansion deserves as much strategy as new-logo acquisition.

Diagnose before you optimize

~10	**3–5**	**Above avg.**
average search position (baseline)	target position range	CTR at current position

A Google Search Console audit showed the site already earns periodic organic traffic with an above-average click-through rate at an average position of ~10 — an efficient, under-ranked asset. That reframed the SEO priority entirely: the constraint is ranking position, not traffic volume.

Why it matters strategically: most early-stage sites chase traffic volume first. Here, CTR-at-position data justified prioritizing on-page and authority work to move existing rankings to 3–5, instead of chasing new keyword territory — the capital-efficient sequence for a solo operator with limited content hours.

08 · OUTCOMES

What the strategy actually produced

International credibility

Active or closed engagements in Germany and Australia became the credibility anchor — international accounts convert at a higher rate than domestic interest.

New vertical opened

First wind-sector project marked entry beyond solar and transmission — sourced from account expansion, not new-logo acquisition.

Pricing discipline institutionalized

A defined floor, volume-discount logic, and currency segmentation replaced ad hoc, deal-by-deal pricing.

Qualified pipeline built

Concentrated BES 2026 leads plus a structured ~150-contact database replaced inbound-only demand.

SEO roadmap clarified

Diagnostic reframed the growth lever from 'generate more traffic' to 'close the ranking gap'.

Account recovery playbook

A missed Octopus Australia inbound became a deliberate multi-contact account strategy.

09 · LESSONS LEARNED

What building it actually taught

Positioning is defended with pricing, not messaging

Saying 'premium studio' means nothing; charging European rates in Europe is what makes the claim credible to a buyer comparing quotes.

Existing relationships are a growth channel

The wind vertical opened from inside an account, not from prospecting. Expansion deserves deliberate strategy, not leftover attention.

A missed lead is a process gap, not a lost deal

The Octopus recovery worked because the response was structural (multi-threading), not emotional (chasing one contact).

Diagnose before you optimize

The Search Console audit prevented a wasted 'more content' cycle by proving the constraint was position, not traffic.

"Indian EPCs show interest without converting at the same rate as international clients — which is why Germany and Australia traction has become the credibility anchor for every other conversation."

Full-funnel GTM, tested with real money

Positioning & segmentation · Pricing strategy · B2B outbound · SEO diagnostics · Event-led demand gen · Account management · International GTM · Founder sales · Account expansion

SolarVista3D is a live case study in the core PMM muscles — segmentation, positioning, pricing strategy, channel-specific messaging, and demand generation — applied under founder constraints: no marketing team, no inherited brand equity, every function owned end to end.

Unlike a case study built after the fact from someone else's data, every decision here — the pricing tiers, the exhibition bet, the SEO sequencing, the account-recovery response — was made under real cost and time constraints, with the outcome directly attributable to the strategy chosen.

THANK YOU

Let's build the next market story together.
